

239740_3 (grna, effect +8.573)

Cells behind 239740_3 (grna, effect +8.573)
wells: 4 of 4 wells reporting the guide contributed an object (plate2_r12_c23, plate3_r3_c20, plate3_r9_c18, plate4_r1_c4)
score window: 8.569 to 8.596 (target 8.583 = baseline + effect, baseline 0.009647 from screen_median, +/-1 robust scales of 0.01349 measured once over all 226,467 objects, not per gene)
settings (per screen, not per gene): window half-width 1 robust scale(s); baseline the screen median; score column 'pred'; cap 300 objects; guides summed across the gene's guides
how these cells were chosen -- the arithmetic:
baseline = median per-object pred over EVERY object supplied (226,467 objects, the whole screen and not this coefficient's wells) = 0.00964694
target = baseline + effect = 0.00964694 + 8.57316 = 8.5828 <- baseline + effect
scale = 1.4626 x MAD of those same scores = 0.0134854
window = target +/- 1 x scale = [8.56932, 8.59629]
kept = the objects inside that window, closest first (smallest [pred - target])
per-well count = round(objects in well x guide fraction in well), halves away from zero:
plate2_r12_c23: round(441 x 0.1542) = 77 -> 134 shown (showing all 441 classified cells in the well; the 77 with the highest scores are highlighted -- round(0.1744 x 441) = 77, where 0.1744 is this guide's 0.1542 normalised by 1.131 (the well's fractions sum to 0.8841); trimmed by the montage cap from 441 to 134)
plate3_r3_c20: round(133 x 0.04615) = 25 -> 32 shown (showing all 133 classified cells in the well; the 25 with the highest scores are highlighted -- round(0.1898 x 133) = 25, where 0.1898 is this guide's 0.04615 normalised by 4.113 (the well's fractions sum to 0.2431); trimmed by the montage cap from 133 to 32)
plate3_r9_c18: round(222 x 0.1766) = 167 -> 72 shown (showing all 222 classified cells in the well; the 167 with the highest scores are highlighted -- round(0.7504 x 222) = 167, where 0.7504 is this guide's 0.1766 normalised by 4.249 (the well's fractions sum to 0.2353); trimmed by the montage cap from 222 to 72)
plate4_r1_c4: round(238 x 0.2068) = 58 -> 62 shown (showing all 238 classified cells in the well; the 58 with the highest scores are highlighted -- round(0.2446 x 238) = 58, where 0.2446 is this guide's 0.2068 normalised by 1.183 (the well's fractions sum to 0.8453); trimmed by the montage cap from 238 to 62)
total: 134 + 32 + 72 + 62 = 300 objects shown
the implied score 8.583 lies OUTSIDE the observed range [0.0002173, 0.9997]; no object in this screen scores anything like it
images: png crop source (load images)
capped at 300 of 1,034 objects; the ones closest to the implied score were kept

Guide membership is INFERRED, not observed. This is a pooled screen: the sequencing reports what FRACTION of each well carried 239740_3, never which cells did. The objects shown are those whose classification score sits closest to what the coefficient implies, drawn from wells where 239740_3 was detected. They are candidates consistent with the effect, not genotyped cells, and the per-well count is the expected number the fraction supports rather than a set of identified objects.
